

## **Immediate Dentures Information:**

1. An immediate denture is placed in your mouth on the same day, following the removal of teeth.
2. The gums will shrink once the teeth are taken out and the dentures will require frequent adjustments to keep fitting properly. They will be relined for a better fit approximately 6 weeks after your extractions
3. The dentures may feel uncomfortable between dental visits. Attempt to wear them as much as possible since they help shape the gums. If they are very uncomfortable, at least wear them 2 hours prior to your dental visit so the dentist can see the sore spots in your mouth and adjust these accordingly.
4. Immediate dentures are not meant to last more than 1-2 years and will need to be replaced by permanent dentures. Your dentist will inform you when you are ready for the final dentures.
